ORE REFERENCE STANDARD: CDN-FCM-5

Recommended values and the “Between Lab” Two Standard Deviations

*Gold 0.55 ± 0.07 g/t
Silver 28.4 ± 3.2 g/t
Copper 0.419 ± 0.026 %
Lead 0.175 ± 0.010 %
Zinc 0.645 ± 0.052 %*

PREPARED BY: CDN Resource Laboratories Ltd.

CERTIFIED BY: Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia

INDEPENDENT GEOCHEMIST: Dr. Barry Smee., Ph.D., P. Geo.

DATE OF CERTIFICATION: August 19, 2007

METHOD OF PREPARATION:

Reject ore material was dried, crushed, pulverized and then passed through a 200 mesh screen. The +200 material was discarded. The -200 material was mixed for 5 days in a double-cone blender. Splits were taken and sent to twelve laboratories for round robin assaying. The material has been packaged in nominal 100g lots or 60g lots in tin-top kraft bags which have been individually vacuum-sealed in polyethylene bags.

ORIGIN OF REFERENCE MATERIAL:

The ore was supplied by Hunter Dickinson (Farallon) from their Campo Morado property in Mexico. The Campo Morado precious-metal-bearing, volcanogenic massive sulphide deposits occur in a lower Cretaceous bimodal, calc-alkaline volcanic sequence. Most deposits occur in the upper part of a sequence of felsic flows and heterolithic volcanoclastic rocks or at its contact with overlying chert and argillite. Gold, silver, zinc, and lead are associated with pyrite, quartz, ankerite, sphalerite, chalcopyrite and galena, with minor tennanite-freibergite, arsenopyrite, and pyrrhotite. Standard CDN-FCM-5 was made by combining 280 kg of Farallon material with 280 kg of blank granitic ore.

Approximate chemical composition is as follows:

| | Percent | | | Percent |
|--------------------------------|---------|--|------------------|---------|
| SiO ₂ | 40.3 | | MgO | 1.6 |
| Al ₂ O ₃ | 6.3 | | K ₂ O | 2.0 |
| Fe ₂ O ₃ | 28.1 | | TiO ₂ | 0.3 |
| CaO | 2.5 | | LOI | 15.8 |
| Na ₂ O | 0.8 | | S | 18.7 |

Statistical Procedures:

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. Data from any one laboratory was removed from further calculations when the mean of all analyses from that laboratory failed a t test of the global means of the other laboratories. The means and standard deviations were calculated using all remaining data. Any analysis that fell outside of the mean ±2 standard deviations was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data. This method is different from that used by Government agencies in that the actual “between-laboratory” standard deviation is used in the calculations. This produces upper and lower limits that reflect actual individual analyses rather than a grouped set of analyses. The limits can therefore be used to monitor accuracy from individual analyses, unlike the Confidence Limits published on other standards.

STANDARD REFERENCE MATERIAL CDN-FCM-5

Results from round-robin assaying:

Assay Procedures:

Au: Fire assay pre-concentration, AA or ICP finish (10g sub-sample).

Ag, Cu, Pb, Zn: 4-acid digestion, AA or ICP finish.
